Isold=P153700]. Cutis laxa is a rare connective tissue disorder characterized by loose, hyperextensible skin with decreased reslitence and elasticity leading to a premature aged appearance. The skin changes are often accompanied by extracutaneous manifestations, including pulmonary emphysema, bladder diverticula, pulmonary artery stenosis and pyloric stenosis.

CC manifestations, including pulmonary emphysema, bladder diverticula, pulmonary acceptant and pyloric stenosis.

CC ardiovascular and musculo-skeletal abnormalities observed in Williams-Beuren Syndrome (WBS) [MIM:194050]. WBS is a rare developmental disorder and a contiguous gene deletion syndrome contouring genes from chromosome band 7q11.23.

C1 involving genes from chromosome band 7q11.23.

Stenosis (SVAS) [MIM:185500]. SVAS is a congenital narrowing of confined aorta which can occur sporadically, as an autosomal condition, or as one component of Williams-Beuren
                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives pharmaceutical, veterinary and cosmetic amplications, e.g. as anti-products. The hybrid protein as surgical implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents a human tropoelastin derivative SHELGeltamodified

Isold=F1878: Defects in ELN are a cause of autosomal dominant cutis laxa [MIW:123700]. Cutis laxa is a rare connective tissue disorder characterized by loose, hyperextensible skin with decreased resilience and elasticity leading to a premature aged appearance. The skin changes are often accompanied by extracutaneous manifestations, including pulmonary emphysema, bladder diverticula, pulmonary artery stenosis and pyloric stenosis.

-!- DISEASE: Haploinsufficiency of ELN may be the cause of certain validowascular and musculo-skeletal abnormalities observed in Williams-Beuren syndrome (WBS) [MIM:194056]. WBS is a rare developmental disorder and a contiguous gene deletion syndrome involving genes from chromosome band 7q11.23. Valvalvular aortic stenosis (SVAS) [MIM:185500]. SVAS is a congenital narrowing of the ascending aorta which can occur sporadically, as an autosomal deminant condition, or as one component of Williams-Beuren

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Name=2.7

Isold=P15502-2; Sequence=VSP 004243;

Isold=P15502-2; Sequence=VSP 004243;

Isold=P18EASE: Defects in ELN are a cause of autosomal dominant cutis

laxa [MIM:123700]. Cutis laxa is a rare connective tissue disorder characterized by loose, hyperextensible skin with decreased resilience and elasticity leading to a premature aged appearance. The skin changes are often accompanied by extracutaneous manifestations, including pulmonary emphysema, bladder diverticula, pulmonary artery stenosis and pyloric stenosis.

-!- DISEASE: Haploinsufficiency of ELN may be the cause of certain cardiovascular and musculo-skeletal abnormalities observed in Williams-Beuren syndrome (WBS) [MIM:94050]. WBS is a rare developmental disorder and a contiguous gene deletion syndrome involving genes from chromosome band 7q11.23.

-!- DISEASE: Defects in ELN are the cause of Supravalvular aortic stenosis (SVAS) [MIM:185500]. SVAS is a congenital narrowing of the ascending aorta which can occur sporadically, as an autosomal constant condition, or as one component of Williams-Beuren
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. Michels V.V., Thibodeau S.N., Davis E.C., Bonnefont J.-P., Munnich A., Eyskens B., Gewillig M., Devriendt K., Boyd C.D.;

"Isolated supraval-vular aortic stenosis: functional haploinsufficiency of the elastin gene as a result of nonsense-mediated decay.";

Hum. Genet. 106:577-588(2000).

-!-FUNCTION: Major structural protein of tissues such as aorta and nuchal ligament, which must expand rapidly and recover completely.

-!-SUBUNIT: The polymeric elastin chains are cross-linked together into an extensible 3D network.

-!-SUBCELLULAR LOCATION: Extracellular matrix of elastic fibers.
                                                                                                                                                                                                                                                                                                                                        Frangiskakis J.M., Ewart A.K., Morris C.A., Mervis C.B., Bertrand J., Robinson B.F., Klein B.P., Ensing G.J., Everett L.A., Green E.D., Proeschel C., Gutowski N.J., Noble M., Atkinson D.L., Odelberg S.J., Keating M.T.;

Genomics 23:125-131(1994).

-!- FUNCTION: Major structural protein of tissues such as aorta and nuchal ligament, which must expand rapidly and recover completely.

-!- SUBUNIT: The polymeric elastin chains are cross-linked together into an extensible 3D network.

-!- SUBCELLULAR LOCATION: Extracellular matrix of elastic fibers.
-!- PTM: The crosslinks are made of deaminated Lys.
                                                           Gaps

NRat tropoelastin is synthesized from a 3.5-kilobase mRNA.";
J. Biol. Chem. 263:13504-13507 (1988)
-!-FUNCTION: Major structural protein of tissues such as aorta and nuchal ligament, which must expand rapidly and recover completely.
-!-SUBNIT: The Polymeric elastin chains are cross-linked together into an extensible 3D network.
-!-SUBCELLULAR LOCATION: Extracellular matrix of elastic fibers.
-!-ALTERNAȚIVE PRODUCTS:
